# Telecom Card Admin

||||| A powerful set of tools to fully administrate any (U)SIM card

The growing complexity of wireless card technologies calls for powerful card administration tools. With Card Admin, Gemalto provides a complete set of tools for use by mobile network operators, handset manufacturers, solution providers and partners.

Card Admin provides the necessary means to fully manage any 2G, 3G or CDMA cards in your fleet. It is based on all the latest evolutions in Gemalto and Java Card™ smart card technology.

## File system administration

Card Admin provides an easy graphical interface for our users to browse a card's file system. The tree-like display makes it possible to view, edit and modify the file's contents, which are displayed in an easy-to-read view for most 3GPP 51.011 standard Elementary Files. Basic functionalities such as file creation and deletion are simple, while Card Admin makes it easy to manage secret codes and manage proprietary files and commands on Gemalto and non-Gemalto cards.

- > Browse, edit and modify file content
- > Simple file creation & deletion
- > Manage secret codes
- > Interoperable solution

## Advanced functionalities

Telecom Card Admin offers the most complete set of functionalities to enable our customers and partners to create, edit and modify their 3G phonebooks. It can generate an html report containing the readable content of any 2G or 3G cards and then create a comparison report to see the differences between the two cards. When it comes to standards compliance, Card Admin makes it easy to compare a card's content with 3GPP and GSM standards.

- > Phonebook management
- > Card content report / card content comparison
- > Check standards compliance

Other functionalities include:

- > Simulate 3G network authentication procedure
- > Simulate GBA and VGCS/VBS authentication
- > ISIM and EAP management
- > Scan WAP provisioning data
- > Smart Card Web Server management

## SIM Toolkit & Java Card Applet Administration

This applet makes it child's play for our customers and partners to issue commands to applications from easy-to-use command windows. Also, it makes it possible to display the various types of business application installed on the card, including system-internal applications and custom OP and SIM Toolkit applications. Using the Application Manager available with the Card Admin, it is easy to download your applets into a real card.

## Related products

- > **Gemalto Simulation Suite:** Empower your Card Admin to test your cards and applets with our end-to-end simulation environment.
- > **Gemalto UXP Editor:** A simple and intuitive user interface for browsing and editing (U)SIM XML Profile (UXP) documents.
- > **Training:** Dedicated training sessions are associated with this product range.

## What's in the box?

- > CD ROM containing software, detailed user guide and tutorials,
- > USB smart card reader,
- > Adapter card.
