Network Encryption Security Certification Course

Gemalto's high-speed WAN encryptors provide the fastest, simplest, and easiest way to integrate network security solutions for enterprise and government organizations that need to protect mission-critical data.

With organizations expanding and becoming more geographically dispersed, the global collaboration between partners, suppliers, and customers is forcing a requirement for secure and transparent high-speed communications across the network. Enterprise network and security engineering groups must reach an appropriate balance between enabling communication while securing corporate information.

With proven reliability, scalability, highest throughput, and lowest latency, Gemalto's network security devices are the ideal solution for protecting massive amounts of data in motion (including time-sensitive voice and video streams), and are designed to integrate seamlessly into a network topology.

In this two-day course, students will participate in classroom sessions in which the instructor will provide information on the available network encryption products, the solution's architecture, considerations for installation, and configuration and management options. The classroom session is followed by guided lab sessions in which the student will install and configure the network encryption products.

Course Agenda

- Network Essentials for Understanding WAN Encryption
- Gemalto Encryption Products Review
- Product Features and Architecture
- Deployment Considerations
- Encryptor Configuration and Management
- Security Management Center
